

## Auxiliary file

This file is supplemental material and shows examples of spectral signatures (400–850 nm) from TAIGA dataset for three forest areas in Hyytiälä, Finland. The measured reflectances in Figure 1 are calculated as averages for circular plots with 30-meter diameter. The plots located in the forests that are illustrated in Figures 2–4.

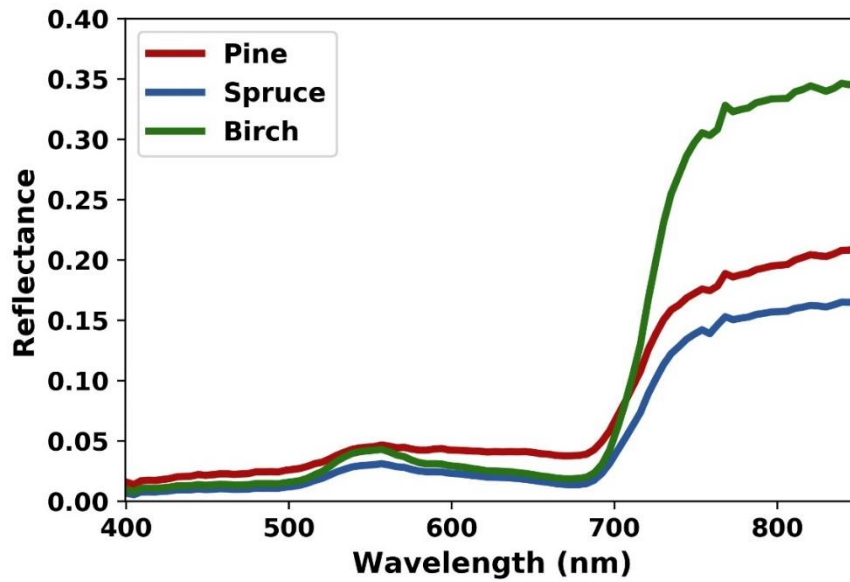

Figure 1. Spectral signatures from TAIGA dataset for three example forests.

Figure 2. Pine stand with small and medium sized trees. Fertility class of the area was sub-xeric heath.

Figure 3. Dense spruce stand with tall trees. Fertility class of the area was mesic heath.

Figure 4. Older birch stand. Fertility class of the area was mesic heath.
